

Kim, Andrew Min Yeop P.

Option B – Product / Business Page

Initial Prompt

Context & Objective You are an expert frontend web developer. I am building a landing page for a new bus queueing and e-ticketing platform designed specifically for commuters and bus operators in Mindanao, Philippines.

Please generate the code for a fully responsive, modern website. I have attached screenshots of the Figma design. Please strictly follow the layout, color scheme, and visual hierarchy shown in these images.

Tech Stack Use React, Next.js, and Tailwind CSS. Ensure the code is clean, modular, and ready for deployment. Use standard modern web fonts (like Inter or Roboto) and ensure accessibility (a11y) standards are met.

Page Structure & Content Requirements Please build the page with the following sections, using this specific copy and structure:

1. Header / Navigation

- Logo area: Placeholder for the app logo.
- Links: Features, Operators, Pricing, Contact.
- Button: "Get Started" (prominent styling).

2. Hero Section (Product Description)

- Headline: Seamless Bus Travel Across Mindanao.
- Sub-headline: Skip the lines at the terminal. Book tickets, track your bus queue in real-time, and board with a simple QR code.
Operating from Davao to Cagayan de Oro, GenSan, and beyond.
- Primary CTA Button: "Download the App"
- Secondary CTA Button: "Partner as an Operator"

3. Features Section Use a grid layout to display the following features with appropriate placeholder icons:

- Smart Queueing: See your real-time position in the terminal line before you even arrive.
- Instant E-Ticketing: Book advance seats securely without waiting at the ticketing booth.
- Local Payments: Pay effortlessly using GCash, Maya, or linked bank accounts.
- Live Route Tracking: GPS updates on bus arrivals and departures across all major Mindanao hubs.

4. Pricing Section Create a clean, side-by-side pricing table or card layout with two tiers:

- Commuter Tier (For Passengers)
 - Price: ₱0 / Free
 - Features: Search routes, book tickets (standard convenience fee applies), real-time queue tracking, digital boarding pass.
 - CTA: "Create Free Account"
- Operator Tier (For Bus Companies)
 - Price: Custom Pricing / Revenue Share
 - Features: Fleet management dashboard, automated queue dispatching, ticket sales analytics, conductor app integration.
 - CTA: "Contact Sales"

5. Call to Action (CTA) Section

- Background: Use a brand-colored background to make it pop (refer to Figma).
- Headline: Ready to modernize your daily commute?
- Sub-headline: Join thousands of passengers traveling smarter across Mindanao.
- Buttons: Add two app store buttons (placeholder SVGs for "Download on the App Store" and "Get it on Google Play").

6. Footer

- Include standard links: Privacy Policy, Terms of Service, Help Center, and social media icon placeholders.

Development Instructions

Please build this as a single-page landing page.

Analyze the provided Figma screenshots carefully. Replicate the border radii, padding, margin spacing, and button hover states exactly as implied by the design.

Make sure the layout transitions gracefully to mobile (stacking the feature grids and pricing tables).

Output the code clearly, starting with the main page structure.

Refinement Prompts (at least 2 more)

Refinement Prompt 1:

There are multiple dead links here. Please fill it with the appropriate content. Even filler or placeholder content is acceptable for now. Also, add a human model endorser holding the phone with the app open to the audience to improve the human connection of the branding.

Refinement Prompt 2:

Context & Objective

We have built the first draft of the landing page for the Mindanao bus queueing and e-ticketing platform. Before we deploy this to production, I need you to act as a full cross-functional product team to scrutinize the current code and UI, identify weaknesses, and then implement the fixes.

Phase 1: The Multi-Perspective Audit

Please review the current codebase from the following four perspectives. For each perspective, identify at least 2 critical improvements that need to be made:

The Commuter (User Lens): I am a passenger waiting at the Ecoland Terminal in Davao. I might be on a slow 3G/4G mobile connection. Is the site loading quickly? Are the buttons massive and easy to tap on a phone screen? Is the text highly readable in bright sunlight?

The Lead Developer (Code Lens): Are the React components modular and DRY (Don't Repeat Yourself)? Is the Tailwind CSS optimized, or are there redundant classes? Are there proper loading states or error boundaries missing?

The QA Tester (Accessibility & Edge Case Lens): Have we semantic HTML tags? Are aria-labels present on all buttons and icons for screen readers? What happens if a user's screen is perfectly in between mobile and desktop breakpoints (like a tablet)? Do the pricing cards break?

The Business Owner (Conversion Lens): Are the "Download the App" and "Partner as an Operator" Call-to-Action (CTA) buttons the absolute most eye-catching elements on the page? Is the value proposition immediately clear without having to scroll?

Phase 2: Execution & Refactoring

Once you have generated the critique from those four perspectives, immediately refactor the code to apply the solutions.

Please provide the updated code, ensuring you:

Fix any mobile responsiveness issues in the Tailwind classes.

Add hover, focus, and active states to all buttons and links for better tactile feedback.

Ensure all images or icons have alt text or aria-labels.

Organize the code neatly so it is ready for deployment on Vercel or Netlify.

Why ride with BUSSIN'?

Everything you need for a frictionless commute.

Smart Queueing

Know your real-time position in the terminal line before you even arrive. No more guessing.

Instant E-Ticketing

Book your seats in advance from anywhere. No more sold-out surprises at the terminal.

Local Payments

Pay seamlessly with GCash, Maya, or your linked bank account. Fast, secure, and cashless.

Live Route Tracking

GPS updates on bus arrivals and departures across all major Mindanao hubs. Always on time.

FOR BUS OPERATORS

Run your fleet smarter, not harder.

BUSSIN' gives bus companies and terminal operators a powerful platform to manage routes, dispatch vehicles, and grow ticket sales — all from one dashboard.

Real-Time Analytics

Track ticket sales, load factors, and revenue across all routes in one place.

Fleet Management

Assign buses, manage drivers, and coordinate departures with automated dispatching.

Conductor App

A dedicated app for conductors to scan QR tickets and manage boarding.

Instant Settlement

Receive daily revenue settlements directly to your bank account.

Made with Replit

<https://content-paster--akim944.replit.app>

Final Reflection:

- What worked well?
 - i. The whole process was a lot easier than I expected. I didn't stumble on any significant difficulties during this Lab.
- What needed manual fixing?

- i. Nothing needed manual fixing with the right prompting. Although there was a lot of stuff missing after the initial prompt, Replit was able to correct these omissions after I gave the refinement prompts.
- What did you learn about prompting?
 - i. I learned a lot about meta-prompting to create better outputs. This activity made me realize the powerful potential of AI in building meaningful things. It lowers the barrier to entry and enables access to tools that would take years to master without AI.
